

Project semester 2 report

Fonts

The concept was a shoes website since we got 2 shoes as a product. I did some research on shoes websites and brands like Nike, Adidas none of them use any complicated fonts like. Mostly sans serif boldness round and easy to read.

The Nike, Adidas and Reebok websites have pretty much the same layout/look, not sure what that was about. Websites are mostly black and white. Most of the colours are from the image of the products itself.

Colour

Didn't pick any special colour for the website, I use the dark-default colour of Bootstrap for footers and some other things. Also an orange call-to-action colour button. Was thinking of some salmon colour since the slogan was salmon skin shoes.

The first 2 weeks I was doing mostly HTML CSS and doing research for layout. Week 3-4 was doing functional JS, kinda working my way down the assignment we got. Was saving week 5 for report and styling but I didn't finish the edit pages.

Did download and use Font-Face for the first time not using CDN Google fonts, also download Bootstrap try to get more comfortable, better at it with the customise and other things. Also learn a JS function I learn `map()`

Sass live extensions always take 4-5sec to load every time I save something. That is a bit annoying. Not sure if my files are in correct order either

Problem at the last week and final delivery

Things were smooth until last week. Had some trouble uploading images to strapi. Kinda just copy and paste the image code from strapi document. I don't really understand much of what the code is doing. Oliver tried to explain to another pau to do POST via html. I will have a look during christmas.

I wanted to delete a single product on cart but since the `localStorage.removeItem` removed the key meaning the whole item arrays list. Think i was onto something with the same metode as the total price of the products but didn't quite get it.

When I was done with the edit/add product all hell broke loose. I only designed the website layout for the products that already exist in the api. After I added a new product in, the whole layout got messed up. Product, details, cart page sum price etc. had to be redo many things. But didnt get time to fix the cart layout.

Could have export/import some to different files to make it less messy. But some of them I tried to move but not working, not sure why, also not sure that the different files to put in are there correct files to put in? Or it is up to me. Like sometimes I'm not sure about what is a component or utility.

Also they are a message if(`cart.length === 0`) display empty card i have to reuse 2 times. Not sure how to fit it in a reusable function.

API

Since i didn't have a custom api i could not put up my website to netlify and do the wcag/accessibility check. Nor for a portfolio later..

Bug

There is a bug that I can't figure out what is going on. I think it has to be with an image uploading code, type of the files. Or the feature product toggle. But most of the time it works if I add a new product to strapi. The product is there but not showing on the website.
